Select “Clinical Microbiology”
at the top of the homepage

Preface

This booklet contains up-to-date information to assist the clinician in making decisions concerning antimicrobial therapy and testing.

These tables summarize susceptibility data obtained for organisms isolated in the UCLA Clinical Microbiology Laboratory in 2023.

In order to provide the most meaningful information, the laboratory is selective in reporting antimicrobial susceptibility results.

Reporting guidelines are based on:

1. Identity of the organism
2. Body site of culture
3. Overall antibiogram of the organism
4. Therapeutically relevant antimicrobials
5. Formulary status of the antimicrobial

Non-formulary drugs are not routinely reported and controlled formulary agents are reported only in the appropriate setting: e.g. amikacin and tobramycin if resistant to gentamicin. Results of all relevant drugs tested, including those not reported, are available upon request.

We thank:

- Daniel Uslan, MD, Chief Infection Prevention
Tara Vijayan, MD, Medical Director, Adult ASP
Ishminder Kaur, MD, Medical Director, Pediatric ASP
Kavitha Prabaker, MD, Hospital Epidemiologist SMH
Meganne Kanatani, PharmD, ID Pharmacist
Christine Pham, PharmD, ID Pharmacist
Ethan Smith, PharmD, ID Pharmacist
Lynn Chan, Pharm D, BCIDP ID Pharmacist
Allison Tsan, CLS, Sr. Specialist, Brentwood Annex
Stephanie Horiuchi, CLS, Sr. Specialist, Brentwood Annex

Guidelines for Interpretation of Minimal Inhibitory Concentrations (MICs)

MICs are interpreted as susceptible, susceptible dose dependent, intermediate, resistant, or non-susceptible according to Clinical and Laboratory Standards Institute (CLSI) M100, 34th edition guidelines. When deciding whether the interpretation is meaningful, one should consider the antimicrobial pharmacokinetics, taking into account dosage and route of administration, the infecting organism and site of infection, and previous clinical experience.

For antimicrobials without interpretive criteria consultation with Infectious Diseases strongly advised.

For additional information, please call the antimicrobial testing laboratory, or Antimicrobial Stewardship hotline.

Resources at UCLA through the Antimicrobial Stewardship Program (ASP)

The Antimicrobial Stewardship Program (ASP) has made resources available for the sole purpose of improving clinical outcomes of patients with infections. Questions and guidance on interpretation of culture reports (contaminant/pathogen), drug dosing, etc. are welcome. The ASP can be contacted numerous ways, depending on the urgency and clinical needs:

ASP Helpdesk/Consultation Email:

antimicrobialstewardship@mednet.ucla.edu

Website: <https://asp.mednet.ucla.edu/pages/>

Note that the website has a **guidebook**, with detailed information about specific clinical syndromes, interpretation of microbiology reports, and guidelines for treatment.

We encourage you to reach out to the program with questions. The program is staffed by:

- Christine Pham, PharmD, ID Pharmacist
- Ethan Smith, PharmD, ID Pharmacist
- Lynn Chan, PharmD, BCID, ID Pharmacist
- Meganne Kanatani, PharmD, ID Pharmacist
- Daniel Uslan, MD, Chief Infection Prevention
- Tara Vijayan, MD, Medical Director, Adult ASP
- Ishminder Kaur, MD, Medical Director, Pediatric ASP
- Kavitha Prabaker, MD, Hospital Epidemiologist SMH
- Bushra Rahman, MPH, Program Manager
- Omai Garner, PhD, Section Chief Clinical Microbiology
- Sukantha Chandrasekaran, PhD, D(ABMM), Associate Director, Clinical Microbiology

Glossary and Acronyms

—	Not routinely tested and/or not applicable
%R	Percent resistant
%S	Percent susceptible
Cipro R	Ciprofloxacin resistant
CP CRE	Carbapenemase producing carbapenem resistant Enterobacteriales
CRE	Carbapenem Resistant Enterobacteriales
CRPA	Carbapenem-Resistant <i>Pseudomonas aeruginosa</i>
I	Intermediate
ICU	Intensive care unit
IP	Inpatient (excludes intensive care unit and Emergency Department)
MDR	Multi-drug resistant
Mero R	Meropenem resistant
MIC	Minimal inhibitory concentration µg/mL
MRSA	Methicillin resistant <i>Staphylococcus aureus</i>
MSSA	Methicillin susceptible <i>Staphylococcus aureus</i>
Non-CP CRE	Non-Carbapenemase producing carbapenem resistant Enterobacteriales
OP	Outpatient (includes Emergency Department collections)
Pip-Tazo R	Piperacillin tazobactam resistant
R	Resistant, can be resistant due to intrinsic resistance
S	Susceptible
SDD	Susceptible dose dependent
spp.	Species
UTIs	Urinary tract infections
V	Variable
VRE	Vancomycin-resistant <i>Enterococcus</i>

¹ % susceptible for penicillin, cefotaxime and ceftriaxone applies to patients with meningitis.

² % susceptible for penicillin, cefotaxime and ceftriaxone applies to patients without meningitis.

³ Excluding *Streptococcus anginosus group*.

⁴ 29% Intermediate (MIC 0.25-2 µg/ml).

Table 5. Miscellaneous Gram-negative Bacteria

Organism	No. Isolates	% beta-lactamase positive ¹
<i>Haemophilus influenzae</i>	183 (pts. >21 y.o) 37 (pts. ≤21 y.o.)	34 27
<i>Moraxella catarrhalis</i>	46 (pts. >21 y.o) 11 (pts. ≤21 y.o.)	96 100
<i>Neisseria gonorrhoeae</i>	The current therapy recommendation is ceftriaxone. Culture and susceptibility testing should be performed in cases of treatment failure. See https://www.cdc.gov/gonorrhea/about/index.html PER STD 2021 treatment guidelines, the recommended treatment for gonorrhea is ceftriaxone 500 mg IM x 1 for patients <150 kg, 1g for patients ≥ 150 kg. Doxycycline 100mg twice daily for 7 days is recommended if there is suspicion or confirmed Chlamydia co-infection	
<i>Neisseria meningitidis</i>	The current therapy recommendation is ceftriaxone for treating meningococcal infections. Penicillin may be considered after susceptibilities return and MIC is ≤0.12 µg/mL (Antimicrob Agents Chemother 56:2268, 2012). Reports have noted some isolates with resistance to fluoroquinolones, agents often used for prophylaxis (MMWR. 2008. 57:173-175). Sanford guide 2022 Recommended: Ceftriaxone Alternative: Meropenem	

¹ Resistant to ampicillin, amoxicillin, and penicillin.

¹ Restricted formulary. ID consult required.

² Interpretations are based on FDA breakpoints. There are no current CLSI breakpoints available for these drugs. Please refer to the FDA website at: <https://www.fda.gov/drugs/development-resources/antibacterial-susceptibility-test-interpretive-criteria>.

³ FDA guidelines indicated that clinical efficacy was shown for *Citrobacter freundii*, *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella oxytoca* & *Klebsiella pneumonia*.

⁴ FDA breakpoint for Omadacycline applies to *Klebsiella pneumoniae* only and indicated for Community Acquired Bacterial Pneumonia (CABP) and Acute Bacterial Skin/Skin Structure Infections (ABSSI).

⁵ CRE: Enterobacteriales resistant to one or more carbapenem i.e. Ertapenem, Imipenem or Meropenem

⁶ Amikacin for *Pseudomonas aeruginosa* is for Urine isolates only.

⁷ *Acinetobacter baumannii complex* includes *A. baumannii*, *A. calcoaceticus*, *A. pittii* and *A. nosocomialis*.

⁸ Calculated from fewer than the standard recommendation of 30 isolates.

Table 7. Pediatrics (\leq 21 y.o.) Gram-negative Bacteria – Non-Urine Isolates, % Susceptible

Organism	No. Isolates	Penicillins			Cephalosporins			Carbapenems			Aminoglycosides		Fluoroquinolone	Other			
		Ampicillin ¹	Amoxicillin-Clavulanic acid	Ampicillin-sulbactam ¹	Piperacillin-tazobactam	Cefazolin	Cefepime	Ceftazidime	Ceftriaxone ²	Ertapenem	Imipenem	Meropenem	Amikacin	Gentamicin	Tobramycin	Ciprofloxacin ³	Trimethoprim – sulfamethoxazole
<i>Enterobacter cloacae complex</i> ⁴	31	R	R	R	94	R	100	— ⁵	— ⁵	100	100	100	100	100	100	100	94
<i>Escherichia coli</i>	59	—	75	—	97	61	83	85	75	100	100	100	95	90	90	80	70
<i>Klebsiella pneumoniae</i>	47	R	83	—	87	68	85	85	83	100	100	100	100	92	92	87	77
<i>Serratia marcescens</i>	24 ⁶	R	R	R	92	R	96	— ⁵	— ⁵	100	96	100	92	92	75	79	96
<i>Pseudomonas aeruginosa</i>	75	R	R	R	91	R	91	92	R	R	84	91	— ⁷	— ⁷	97	91	R

¹ Ampicillin and Ampicillin-sulbactam testing were discontinued on July 26, 2016.

² Ceftriaxone and cefotaxime have comparable activity against *Enterobacteriaceae*.

³ Ciprofloxacin is associated with arthropathy and histological changes in weight-bearing joints of juvenile animals and should only be used when no safe and effective alternatives exist.

⁴ *Enterobacter cloacae* complex includes *E. cloacae*, *E. asburiae*, and *E. hormaecheii*.

⁵ 3rd generation cephalosporins should not be used for serious infections.

⁶ Calculated from fewer than the standard recommendation of 30 isolates

⁷ As of 2023, *Pseudomonas aeruginosa* breakpoints were revised, and tobramycin is now the only recommended aminoglycoside for systemic therapy. Amikacin is effective against *P. aeruginosa* only in urinary tract infections. Gentamicin is no longer recommended for *P. aeruginosa* infection at any site.

Table 8. Pediatrics (\leq 21 y.o.) Gram-negative Bacteria – Urine Isolates, % Susceptible

Organism	No. Isolates	Penicillins		Cephalosporins			Carbapenems			Amino-glycosides		Fluoroqui-nolone	Other			
		Ampicillin	Amoxicillin - Clavulanic acid	Oral Cephalosporins ¹	Cefepime	Ceftazidime	Ceftriaxone	Ertapenem	Imipenem	Meropenem	Amikacin	Gentamicin	Tobramycin	Ciprofloxacin ²	Trimethoprim – sulfamethoxazole	Nitrofurantoin
<i>Enterobacter cloacae complex</i> ³	14 ⁴	R	R	R	86	—	—	93	100	100	—	100	—	100	93	50
<i>Klebsiella (Enterobacter) aerogenes</i>	17 ⁴	R	R	R	88	—	—	100	100	100	—	94	—	82	88	12
<i>Escherichia coli</i>	882	58	86	91	—	—	92	100	99	99	—	91	91	85	76	99
<i>Klebsiella pneumoniae</i>	91	R	95	91	—	—	92	100	99	99	—	98	95	84	86	23
<i>Proteus mirabilis</i>	85	84	84	96	—	—	98	100	— ⁵	99	—	95	97	93	85	R
<i>Pseudomonas aeruginosa</i>	26 ⁴	R	R	R	89	89	R	R	92	92	100	— ⁶	100	96	R	R

¹ Oral Cephalosporins include Cefpodoxime and Cephalexin for treatment of uncomplicated urinary tract infections.

² Ciprofloxacin is associated with arthropathy and histological changes in weight-bearing joints of juvenile animals and should only be used when no safe and effective alternatives exist.

³ *Enterobacter cloacae complex* includes *E.cloacae*, *E.asburiae*, and *E.hormaecheii*.

⁴ Calculated from fewer than the standard recommendation of 30 isolates.

⁵ *Proteus* spp. may have elevated imipenem MIC by mechanisms other than production of carbapenemases.

⁶ As of 2023, *Pseudomonas aeruginosa* breakpoints were revised, and tobramycin is now the only recommended aminoglycoside for systemic therapy. Amikacin is effective against *P. aeruginosa* only in urinary tract infections. Gentamicin is no longer recommended for *P. aeruginosa* infection at any site.

¹ Calculated from fewer than the standard recommendation of 30 isolates.

² % susceptible for penicillin, cefotaxime and ceftriaxone applies to patients with meningitis.

³ % susceptible for penicillin, cefotaxime and ceftriaxone applies to patients without meningitis.

Table 10. Yeasts, %S, %I, %SDD, %R, 2022-2023

1. Most yeast infections can be treated empirically. Antifungal testing of yeasts may be warranted for the following:
 - Oropharyngeal or vaginal infections due to *Candida* spp. in patients who appear to be failing therapy.
 - Management of invasive *Candida* spp. infections when utility of an azole agent is uncertain (e.g., *Candida* spp. other than *C. albicans*), per IDSA guidelines for candidiasis: CID 2016;62, E1-E50. Clinical Practice Guidelines for the Management of Candidiasis.
2. Isolation of *Candida* in respiratory specimens of immunocompetent patients should be interpreted as airway colonization.

² CLSI. Performance Standards for Antifungal Susceptibility Testing of Yeasts. 2nd ed. CLSI Standard M27. Wayne, PA.: Clinical and Laboratory Standards Institute; 2017

³ Not all isolates were tested against all four antifungal agents.

⁴ For *C. glabrata* and voriconazole, current data are insufficient to demonstrate correlation between *in vitro* susceptibility testing and clinical outcome.

⁵ Calculated from fewer than the standard recommendation of 30 isolates.

Table 11. Emerging Resistance Concerns

When unusual antimicrobial resistance (R) is observed, an Infectious Disease (ID) consult is strongly suggested to optimize therapy and prevent nosocomial transmission.

Organism	Resistant to:	Percent Resistant:	Therapeutic Options	Comments
<i>Staphylococcus aureus</i>	Oxacillin (MRSA)	Adults (>21 y.o.) Inpatients (n=1012) ¹ 36% Outpatients (n=1423) ¹ 18% Pediatrics (\leq 21 y.o.) Inpatients (n=146) ¹ 15% Outpatients (n=317) ¹ 10%	vancomycin ceftaroline daptomycin	MRSA are clinically resistant to all β -lactams, β -lactam / β -lactamase inhibitor combinations and carbapenems, excluding ceftaroline. ¹ MRSA are also typically resistant to fluoroquinolones
<i>Streptococcus pneumoniae</i> (non-meningitis)	Penicillin (MIC > 2 μ g/ml)	All isolates (n=53) Penicillin MIC >2 μ g/ml 2%	ceftriaxone or cefotaxime or vancomycin	If susceptible (MIC \leq 2.0 μ g/ml), high dose penicillin has been shown to be effective for infections other than meningitis. ²
<i>Streptococcus pneumoniae</i> (non-meningitis)	Cefotaxime, Ceftriaxone (Penicillin resistant always)	All isolates (n=53) Cefotaxime and ceftriaxone Low level R (n=1) 2% High level R (n=1) 2%	vancomycin levofloxacin	If low-level resistance (MIC=2.0 μ g/ml), high dose cefotaxime or ceftriaxone may be effective for infections other than meningitis. ²

¹ Isolates from all sources.

Table 11. Emerging Resistance Concerns (cont.)

When unusual antimicrobial resistance (R) is observed, an Infectious Disease (ID) consult is strongly suggested to optimize therapy and prevent nosocomial transmission.

Organism	Resistant to:	Percent Resistant:	Therapeutic Options	Comments
Viridans group <i>Streptococcus</i> (excludes <i>S. anginosus</i> group ¹)	penicillin	Blood isolates (n = 57) low level R (n=15) 26% high level R (n=1) 2%	vancomycin or penicillin + aminoglycoside	Level of penicillin resistance is particularly useful in guiding therapy for endocarditis. ² For low level resistance, MICs are 0.25–2.0 µg/ml; for high level, MICs are >2.0 µg/ml. ³
<i>Enterococcus</i> spp.	vancomycin (VRE)	Blood isolates <i>E. faecium</i> (n = 90) 66% <i>E. faecalis</i> (n = 82) 2%	Check in vitro susceptibility results and contact Infectious Diseases.	Vancomycin-resistant <i>Enterococcus</i> (VRE) are often resistant to many potentially useful agents. Therapeutic management must be determined on a case-by-case basis.
	High level gentamicin 500 µg/mL	Blood isolates <i>E. faecium</i> (n = 90) 8% <i>E. faecalis</i> (n = 82) 26%	Check in vitro susceptibility results and contact Infectious Diseases.	Both aminoglycoside and cell wall active agent (ampicillin, penicillin, or vancomycin) must be susceptible for synergistic interaction.

¹ *Streptococcus anginosus*, *Streptococcus intermedius*, and *Streptococcus constellatus*

³ Baddour, L. M., et al. (2015). Infective Endocarditis in Adults: Diagnosis, Antimicrobial Therapy, and Management of Complications: A Scientific Statement for Healthcare Professionals From the American Heart Association. *Circulation*, 132(15), 1435–1486.

Table 11. Emerging Resistance Concerns (cont.)

Organism	Resistant to:	Percent Resistant:	Therapeutic Options	Comments
<i>Klebsiella</i> spp. (not aerogenes) <i>E. coli</i>	ceftriaxone or other 3rd generation cephalosporin	Blood isolates: <i>Klebsiella</i> spp. (n = 190) 25% <i>E. coli</i> (n = 333) 32%	ertapenem ciprofloxacin	In vitro resistance to 3rd generation cephalosporins suggests the strain is producing extended-spectrum β-lactamases (ESBL), or AmpC
<i>K. pneumoniae</i> and other <i>Enterobacteriales</i>	carbapenem	All isolates (n = 18395): 3% Blood isolates (n=682): 2%	Check in vitro susceptibility results and contact Infectious Diseases.	Decreased susceptibility to carbapenems is increasing primarily among ICU patients' isolates. These isolates may be resistant to all available antimicrobial agents.
<i>Citrobacter freundii</i> complex <i>Enterobacter cloacae</i> complex <i>Klebsiella</i> (<i>Enterobacter</i>) <i>aerogenes</i>	3rd generation cephalosporins (e.g. ceftriaxone)	See comments	cefepime aminoglycoside ciprofloxacin ertapenem meropenem trimeth-sulfa	Organisms listed typically produce inducible β-lactamases. Isolates that appear susceptible to 3rd generation cephalosporins may develop resistance during therapy. ¹
<i>Pseudomonas aeruginosa</i>	cefepime and/or piperacillin-tazobactam	All isolates: (n=1568) 15%	Check in vitro susceptibility results and contact Infectious Diseases.	Therapeutic management must be determined on a case by case basis.
<i>Acinetobacter baumannii</i> complex	amikacin, cefepime, ceftazidime, ciprofloxacin, meropenem, piperacillin-tazobactam, and trimeth-sulfa	All isolates: (n=109) 16%	Check in vitro susceptibility results and contact Infectious Diseases.	Therapeutic management must be determined on a case by case basis.

Table 11. Emerging Resistance Concerns (cont.)

When specific antimicrobial resistance (R) is detected, an Infectious Disease (ID) consult is strongly suggested.

Organism	If Resistant to:	Therapeutic Options	Comments
<i>Candida krusei</i>	micafungin	voriconazole ¹ amphotericin ²	Typically susceptible to micafungin. Breakthrough infections have been reported. ³
	voriconazole	micafungin ⁴ amphotericin ^{2, 5}	Intrinsically resistant to fluconazole ^{6, 7} Typically susceptible to voriconazole ^{6, 7}
<i>Candida glabrata</i>	micafungin	fluconazole ⁸ voriconazole ¹ amphotericin ^{2, 5}	echinocandin resistance may be emerging. ⁶
	fluconazole	voriconazole ¹ micafungin ⁴ amphotericin ^{2, 5}	Typically resistant to fluconazole. ^{6, 7}
<i>Candida albicans</i>	micafungin	fluconazole ⁸ amphotericin ^{2, 5}	Typically susceptible to micafungin. ^{6, 7}
	fluconazole	micafungin ⁴ amphotericin ^{2, 5}	Typically susceptible to fluconazole but resistance can develop during therapy. ^{6, 7}
<i>Candida auris</i>	Often resistant to azoles, amphotericin and some are echinocandin resistant	Infectious Disease consult is strongly suggested	<i>Candida auris</i> is an emerging multi-drug resistant organism, able to cause wide range of infections.

For additional resistance data, see Tables 5-13.

These are therapeutic options in adults. For therapeutic options in pediatric patients, please contact the Antimicrobial Stewardship.

¹ Voriconazole has poor penetration in urine.

² Liposomal amphotericin has poor penetration in urine.

³ Tavernier, E., et al. Development of echinocandin resistance in *Candida krusei* isolates following exposure to micafungin and caspofungin in a BM transplant unit. Bone Marrow Transplant 50, 158–160 (2015)

⁴ micafungin may not reach therapeutic concentration in the CSF, vitreous fluid or urine.

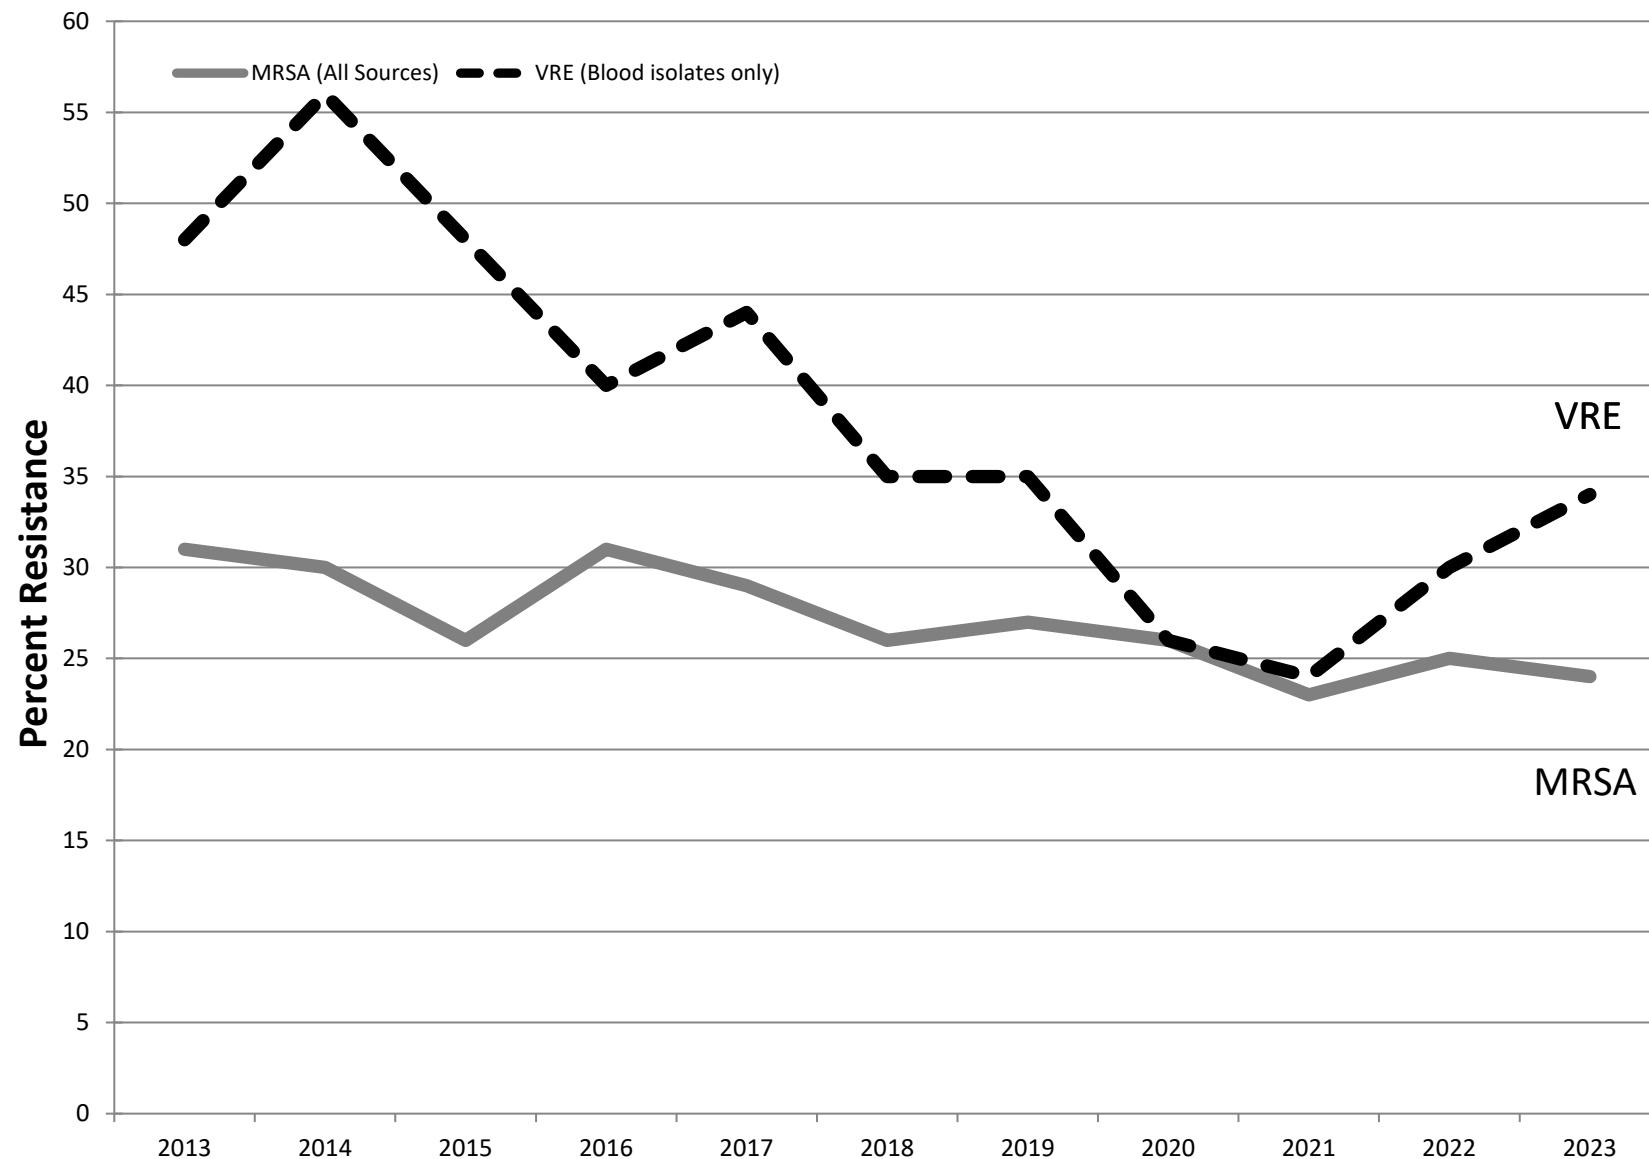

⁵ Among patients without baseline renal dysfunction and suspected azole- and echinocandin-resistant *Candida* infections, liposomal amphotericin B is recommended. Infectious Disease consult is highly recommended.

Total	5	

Table 16. CSF: One Isolate per Patient, 2023

The following antimicrobial agents are not the drug of choice and may not be effective for treating infections caused by bacteria isolated from CSF:

- Agents administered by oral route only
- First- and second-generation cephalosporins and cephemycins
- Doripenem, ertapenem, and imipenem
- Clindamycin
- Lefamulin
- Macrolides
- Tetracyclines
- Fluoroquinolones

n = 23

	Number of Isolates

<i>Mycobacterium mucogenicum</i>	1	1		
<i>Mycobacterium goodii</i>	1	1		
Total Mycobacteria	557	509	43	5

¹ Some patients have isolates in more than one source.

Table 18. Mycobacteria Antimicrobial Susceptibility Testing

1. *Mycobacterium tuberculosis complex:*

Performed on first isolate per patient; performed on additional isolates recovered after 3 months, testing performed at reference lab.

Primary agents Secondary agents

Rifampin	Amikacin
Isoniazid (INH)	Capreomycin
Pyrazinamide	Ciprofloxacin
Ethambutol	Ethionamide
	p-aminosalicylic acid
	Streptomycin

2. *Mycobacterium avium complex:*

Performed on first isolate per patient; performed on additional isolates recovered after 3 months, testing performed at reference lab.

Correlation between in vitro susceptibility and clinical response has been demonstrated only for clarithromycin. Clarithromycin results predict azithromycin results. Susceptibility testing for clarithromycin should be performed on isolates from patients only when failing prior macrolide therapy or prophylaxis.

3. Rapidly growing *Mycobacterium* spp. (e.g. *M. abscessus*, *M. chelonae*, and *M. fortuitum* group):

Performed on one isolate per patient, testing performed in-house.

Additional agents on request.

Agents routinely reported

amikacin
cefoxitin
ciprofloxacin
clarithromycin (inducible)
doxycycline
trimethoprim-sulfamethoxazole

Agents conditionally reported

imipenem
linezolid
meropenem
moxifloxacin
tigecycline
tobramycin (<i>M. chelonae</i> isolates only)

M. abscessus Clarithromycin and Amikacin drug resistance prediction and subspecies identification by Whole Genome Sequencing is performed by physician request only.

4. Other Nontuberculous Mycobacteria (NTM):

M. kansasii – Performed on one isolate per patient, at reference lab.

Other NTM by physician request.

Table 19. California Mycobacterium tuberculosis % Resistant, 2013-2023

Data derived from California Department of Public Health Annual report "California TB Snapshot"¹

Antimicrobial Agent	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023

△ RTU= "Ready to Use" IV bags

* Includes drug acquisition cost plus estimated preparation and administrative costs; charges rounded up to the nearest \$0.05

** CBA: Colistin-base activity

***TMP/SMX: Trimethoprim/Sulfamethoxazole

1 Use of Controlled Formulary (CF) antimicrobials is restricted to UCLA Health System-approved criteria.

2 Restricted: suspected or documented *Pseudomonas aeruginosa* infection and in the management of gram-negative meningitis.

3 Restricted: surgical prophylaxis; refer to Pre-incisional Antimicrobial Recommendations.

4 Restricted: aerobic gram-negative infections in patients with documented IgE-mediated hypersensitivity to beta-lactam antibiotics.

5 For Pediatric patients: restricted to use by Pediatric Infectious Diseases Service approval.

6 Restricted: clinical deterioration on concurrent/recent antimicrobials or febrile neutropenia and/or overt sepsis in an immunocompromised patient.

7 Restricted: organisms with suspected/documentary resistance to gentamicin and tobramycin.

Restricted: infections caused by organisms with suspected/documentary resistance to gentamicin.

Restricted: requires formal consultation by an Infectious Diseases physician; exceptions noted in HS 1444.

Injection: For use in patients unable to tolerate the oral formulations.

Restricted: suspected or documented VRE infection, documented allergy to vancomycin (not Redman's Syndrome).

For prophylaxis of invasive *Aspergillus* and *Candida* infections in severely immunocompromised patients.

8 Restricted: treatment of suspected/documentary invasive aspergillosis. For treatment of infections caused by *S. apiospermum*, *Fusarium* species (including *F. solani*) and non-albicans *Candida* species in patients intolerant of, or refractory to other therapy.

Table 23. Indications for Performing Routine Antimicrobial Susceptibility Tests – Aerobic Bacteria

Susceptibility tests will be performed as follows:

1. Blood—all isolates except*:

- Aerococcus* spp.¹ (excludes *Aerococcus urinae*)
- Bacillus* spp.¹
- Corynebacterium* spp. ¹ (excludes *Corynebacterium jeikeium* and *Corynebacterium striatum*)
- Coagulase-negative *Staphylococcus*^{1,2}
- Cutibacterium (Propionibacterium) acnes*¹
- Micrococcus* spp.¹
- Viridans group *Streptococcus*¹ (excludes *Streptococcus anginosus* group)

2. Urine

>10⁵ CFU/ml (1 or 2 species)

>50,000 CFU/ml (pure culture):

Gram-negative bacilli; *Staphylococcus aureus*

Urine from Urology – Susceptibility performed based on the following criteria upon request

Workup for up to 5 organisms;

Any quantity of pathogens

- Gram-negative bacilli
- *Staphylococcus aureus*

Potential pathogens – Colony count of $\geq 50K$ for ≤ 2 organisms

- Coagulase Negative *Staphylococcus*
- Viridans *Streptococcus*
- *Corynebacterium* species
- Yeast
- *Staphylococcus saprophyticus*
- *Aerococcus* species
- Beta hemolytic *Streptococcus*

Enterococcus species

- ≤ 2 organism any quantity
- Colony count of $< 50K$ Predominant in mix culture
- Colony count of $\geq 50K$ Non-predominant in mixed culture

3. Respiratory (sputum, nasopharynx, bronchial washing and tracheal aspirate):

Moderate /many growth ≤ 2 potential pathogens

Cystic fibrosis patients: any quantity of gram-negative bacilli, *S. aureus*, *S. pneumoniae*

4. Stool

Salmonella spp. (≤ 3 mo. only or susceptibilities performed on all isolates of *S. typhi* and *S. paratyphi*)

Shigella spp.

Yersinia spp.

Vibrio spp.

* Neonates (≤ 3 months), susceptibilities performed on all isolates

¹ Susceptibilities performed if isolated from multiple cultures

² Susceptibilities performed on all isolates of *S. lugdunensis*

Table 23. (cont.) Indications for Performing Routine Antimicrobial Susceptibility Tests – Aerobic Bacteria

5. Wounds, abscesses and other contaminated body sites, ≤2 potential pathogens.
6. If isolate is from sterile body site, susceptibility testing will be performed on subsequent isolates from similar site(s) every 3 days. Exception: *S. aureus* and *P. aeruginosa* tested each day of collection from blood.
7. If isolate is from non-sterile body site, susceptibility testing will be performed on subsequent isolates from similar site(s) every 5 days.

Additional notes:

- Susceptibility tests will not be performed on more than two potential pathogens per culture unless specifically requested following discussion with clinician.
- Blood and CSF isolates are held for 1 year.
- Other potentially significant isolates are held in lab for 7 days. Contact lab at (310) 794-2758 within 48 hours if susceptibilities are desired.

Table 24. Antimicrobial Agents Routinely Reported – Aerobic Bacteria

Primary antimicrobials	Conditions for supplemental antimicrobial reporting	Supplemental antimicrobial(s) ¹
<i>E. coli, Klebsiella spp., P. mirabilis</i> – Excludes urine isolates		
amoxicillin/clavulanate		
cefazolin		
ceftriaxone	Resistant to ceftriaxone	ertapenem (>18 y.o.), imipenem & meropenem (<18 y.o.)
ciprofloxacin (>11 y.o.)	Resistant to ertapenem (>18 y.o.)	imipenem, meropenem
gentamicin	Resistant to gentamicin	amikacin, tobramycin
piperacillin-tazobactam	Resistant to piperacillin-tazobactam	ertapenem (>18 y.o.), imipenem & meropenem (<18 y.o.)
trimethoprim-sulfamethoxazole		
<i>E. coli, Klebsiella spp., P. mirabilis</i> – Urine isolates		
ampicillin		
amoxicillin/clavulanate		
oral cephalosporins ²		
ceftriaxone	Resistant to ceftriaxone	ertapenem (>18 y.o.), imipenem & meropenem (<18 y.o.)
ciprofloxacin (>11 y.o.)	Resistant to ertapenem (>18 y.o.)	imipenem, meropenem
gentamicin	Resistant to gentamicin	tobramycin
nitrofurantoin		
piperacillin-tazobactam	Resistant to piperacillin-tazobactam	ertapenem (>18 y.o.), imipenem & meropenem (<18 y.o.)
trimethoprim-sulfamethoxazole		

¹ The following additional antimicrobial agents are reported on carbapenem resistant Enterobacteriales (resistant to meropenem and/or imipenem): aztreonam, azithromycin, minocycline, moxifloxacin, tigecycline, ceftazidime-avibactam and ceftolozane-tazobactam.

² Cefazolin results should only be used to predict potential effectiveness of oral cephalosporins for uncomplicated UTIs.

Table 24. Antimicrobial Agents Routinely Reported – Aerobic Bacteria (cont.)

Primary antimicrobials	Conditions for supplemental antimicrobial reporting	Supplemental antimicrobial(s) ³
Other Enterobacteriales organisms⁴ – Excludes urine isolates		
amoxicillin/clavulanate cefepime	Resistant to cefepime	ertapenem (>18 y.o.), imipenem & meropenem (\leq 18 y.o.) imipenem, meropenem
Other Enterobacteriales organisms³ – Urine isolates		
ampicillin amoxicillin/clavulanate cefepime	Resistant to cefepime	ertapenem (>18 y.o.), imipenem & meropenem (\leq 18 y.o.) imipenem, meropenem
ceftriaxone ciprofloxacin (>11 y.o.) gentamicin piperacillin-tazobactam ⁵ trimethoprim-sulfamethoxazole	Resistant to ertapenem (>18 y.o.) Not reported for HECK-Y organisms ⁵ Resistant to gentamicin Resistant to piperacillin-tazobactam	amikacin, tobramycin ertapenem (>18 y.o.), imipenem & meropenem (\leq 18 y.o.)

³ The following additional antimicrobial agents are reported on carbapenem resistant Enterobacteriales (resistant to meropenem and/or imipenem): aztreonam, azithromycin, minocycline, moxifloxacin, tigecycline, ceftazidime-avibactam and ceftolozane-tazobactam.

⁴ Enterobacteriales other than *E. coli*, *Klebsiella* spp., *P. mirabilis*, *Salmonella* spp., *Shigella* spp.

⁵ Ceftriaxone not reported for *Citrobacter freundii* complex, *Enterobacter cloacae* complex, *Klebsiella aerogenes*, *Hafnia alvei*, *Yersinia enterocolitica*.

Table 24. Antimicrobial Agents Routinely Reported – Aerobic Bacteria (cont.)

Primary antimicrobials	Conditions for supplemental antimicrobial reporting	Supplemental antimicrobial(s) ¹
<i>Salmonella</i> spp.,¹ <i>Shigella</i> spp.²		
ciprofloxacin (>11 y.o.) trimethoprim-sulfamethoxazole	<i>Shigella</i> spp. Non-fecal sources/resistant to all primary antimicrobials	azithromycin ceftriaxone
<i>Pseudomonas aeruginosa</i>		
cefepime	Resistant to cefepime	imipenem, meropenem, ceftolozane - tazobactam
	Resistant to imipenem or meropenem	ceftolozane - tazobactam
ciprofloxacin (>11 y.o.) Tobramycin piperacillin-tazobactam ceftazidime	ceftolozane – tazobactam MIC ≥4 µg/mL Urine Resistant to piperacillin-tazobactam	cefiderocol amikacin imipenem, meropenem
<i>Acinetobacter</i> spp.		
cefepime ceftazidime ciprofloxacin (>11 y.o.)	Resistant to ceftazidime	imipenem, meropenem
gentamicin piperacillin-tazobactam trimethoprim-sulfamethoxazole	Resistant to meropenem or imipenem Resistant to gentamicin	minocycline amikacin, tobramycin
<i>Stenotrophomonas maltophilia</i>- Sterile body site isolates		
<i>Burkholderia cepacia</i> complex		
levofloxacin (>11 y.o.) minocycline trimethoprim-sulfamethoxazole	<i>Burkholderia cepacia</i> complex <i>Burkholderia cepacia</i> complex	meropenem ceftazidime

¹ If stool isolates, perform on patients ≤3 mo., or if isolate is *Salmonella typhi* or *Salmonella paratyphi A*.

² Susceptibility performed on stool isolates.

Table 24. Antimicrobial Agents Routinely Reported – Aerobic Bacteria (cont.)

Primary antimicrobials	Conditions for supplemental antimicrobial reporting	Supplemental antimicrobial(s)
Nonfermenting Gram Negative Rods not otherwise listed		
cefepime		
ceftazidime	Resistant to ceftazidime	imipenem, meropenem
ciprofloxacin (>11 y.o.)		
gentamicin	If gentamicin >1 µg/ml	amikacin, tobramycin
piperacillin-tazobactam		
trimethoprim-sulfamethoxazole		
<i>Haemophilus influenzae</i>		
Beta-lactamase test	Sterile body site isolates:	Reported upon request:
	If beta-lactamase positive	ceftriaxone
	If beta-lactamase negative	ampicillin, ceftriaxone
	CSF only	Meropenem

Table 24. Antimicrobial Agents Routinely Reported – Aerobic Bacteria (cont.)

Primary antimicrobials	Conditions for supplemental antimicrobial reporting	Supplemental antimicrobial(s)
<i>Staphylococcus</i> spp.		
clindamycin ¹		
oxacillin	S. aureus (exclude Blood and CSF) Resistant to oxacillin (MRSA)	tetracycline/doxycycline, trimethoprim-sulfamethoxazole All beta-lactams considered resistant except ceftaroline
penicillin		
vancomycin	S. aureus on blood (vancomycin $\geq 2\mu\text{g/ml}$) Urine isolates	daptomycin, linezolid ciprofloxacin ² , nitrofurantoin, trimethoprim-sulfamethoxazole
<i>Enterococcus</i> spp.		
ampicillin		
vancomycin	Resistant to vancomycin (VRE) from sterile body sites Sterile body site isolates	daptomycin, doxycycline, linezolid, quinupristin-dalfopristin (excluding <i>E. faecalis</i>), rifampin gentamicin (high level)
	Urine isolates	ciprofloxacin ² , doxycycline, nitrofurantoin
<i>Streptococcus pneumoniae</i>		
amoxicillin, cefotaxime, ceftriaxone, erythromycin ³ , levofloxacin ² , penicillin, tetracycline ³ , trimethoprim-sulfamethoxazole ³ , vancomycin		
Viridans group <i>Streptococcus</i>		
cefotaxime, ceftriaxone, penicillin, vancomycin		
Beta-hemolytic <i>Streptococcus</i>		
Clindamycin ¹ , penicillin, vancomycin		
<i>Listeria monocytogenes</i>		
penicillin, trimethoprim-sulfamethoxazole (penicillin results predicts ampicillin results)		

¹ Excluding urine and CSF isolates

² Patients >11 y.o.

³ Excluding CSF isolates

Table 25: CLSI M62 – Expected Antimicrobial Susceptibility Patterns of the Most Commonly Isolated Nocardia Data Derived from CLSI M62†

Organism	Amoxicillin/ clavulanic acid	Ceftriaxone	Imipenem	Ciprofloxacin	Minocycline	Linezolid	Trimethoprim – sulfamethoxazole	Amikacin	Tobramycin	Clarithromycin

1 S. aureus only, including MRSA

2 beta-lactamase negative

Table 28. Antimicrobial Stewardship

- 1) Treatment of asymptomatic bacteriuria
 - a. A urine culture must ALWAYS be interpreted in the context of the urinalysis and patient symptoms.
 - b. If a patient has no signs of infection on urinalysis and no symptoms of infection, but a positive urine culture, the patient by definition has **asymptomatic bacteriuria**.
 - c. Patients with chronic indwelling catheters, urinary stoma, and neobladders will almost universally have positive urine cultures.
 - d. The only patient populations for which it is recommended to screen for and treat asymptomatic bacteriuria are **pregnant women** and **patients scheduled for a genitourinary surgical procedure**. Screening during the first 2 months of renal transplant is acceptable.
 - e. Avoid routine urine analysis and/or urine cultures for the sole purpose of screening for UTI in asymptomatic patients.
- 2) Treatment of VRE Isolated from stool cultures
 - a. *Enterococcus* are normal bowel flora and do not cause enteric infections, regardless of vancomycin susceptibility.
 - b. Antibiotic treatment of VRE in stool cultures is discouraged, and may lead to increased transmission by causing diarrhea and emergence of antimicrobial resistance among VRE.
- 3) Treatment of *Candida* isolated from bronchoscopic samples in non-neutropenic patients
 - a. Isolation of *Candida*, even in high concentrations, from respiratory samples of immunocompetent patients, including bronchoscopy, should be interpreted as airway colonization.
 - b. Antifungal therapy should not be initiated unless *Candida* is also isolated from sterile specimens or by histologic evidence in tissue from at-risk patients.
- 4) Use of “double coverage” for gram-negative bacteria
 - a. “Double coverage” of suspected gram-negative infections serves the purpose of providing broad spectrum initial empiric coverage until susceptibility data are known.
 - b. No evidence exists to support the superiority of combination therapy over monotherapy for gram-negative infections once susceptibilities are known.
 - c. Once culture identification and susceptibilities have been reported, de-escalation to a single agent is strongly recommended.
- 5) Use of two agents with anaerobic activity to treat infections with potential anaerobic bacteria involvement
 - a. Double anaerobic coverage is not necessary and puts the patient at risk for additional drug toxicities. No data or guidelines support double anaerobic coverage in clinical practice.
 - b. Example: use of piperacillin/tazobactam + metronidazole.
 - c. Two clinical exceptions are:
 - i. Addition of metronidazole to another agent with anaerobic activity to treat *Clostridioides difficile* infection.
 - ii. Clindamycin added to another agent with anaerobic activity when treating necrotizing fasciitis.
